PREFACE

This document has been funded wholly or in part by the United States Environmental Protection Agency under assistance agreement CD994920-96-0 to the South Carolina Department of Natural Resources. The contents of this document do not necessarily reflect the views and policies of the Environmental Protection Agency, nor does mention of trade names or commercial products constitute endorsement or recommendation for use.

[48 FR 45062, Sept. 30, 1983; 49 FR 38945, Oct. 2, 1984]

INTRODUCTION

Wetlands are ecosystems valuable for regulating surface and ground water hydrology by storing and gradually releasing flood water; maintaining water quality by storing nutrients and reducing sediment load and erosion; providing fish and wildlife habitat for food and cover yielding very high biological productivity; and serving human populations with recreational and aesthetic values (Mitsch and Gosselink, 1986).

Total wetlands in the United States are estimated to have originally amounted to about 215 million acres, of which only 108 million acres remained by the 1950s, and only 99 million acres remained by the mid-1970s, a loss of 54% (Frayer et al, 1983; Tiner, 1984). Nationally, 2.6 million acres of wetlands were lost in the decade between the mid-1970s and the mid-1980s, of which 2.5 million acres (98%) were inland freshwater wetlands (Dahl and Johnson, 1991). Nearly half (47%) of all wetlands in the conterminous United States (49 million acres) are located in 10 southeastern states, including South Carolina (Hefner et al, 1994). Historically, South Carolina has lost 28% of its original wetlands to human development and conversion of the landscape.

The U.S. Environmental Protection Agency (EPA) has federal authority over human activity impacting jurisdictional wetlands and is involved in the Clean Water Act (CWA), Section 404, as a reviewer of permit applications submitted to the U.S. Army Corps of Engineers (COE). Section 404 guidelines require use of least environmentally damaging practicable alternatives, avoidance of significant degradation to the aquatic resources, minimization of project impacts, and compliance with water quality and endangered species requirements.

The EPA established an Office of Wetlands Protection in 1986 to provide leadership in building a broad-based effort to protect our nation's wetlands, recognizing that a truly effective program of wetlands protection must be supplemented by non-regulatory approaches through cooperation of federal, state and local agencies, environmental groups, developers, the scientific community and the public. Section 404 is not a comprehensive mechanism for wetlands protection since some wetlands damaging activities (drainage and ground water pumping) occur without discharging dredged or fill material into the nation's waters, and thus not regulated (USEPA, 1988).

Advance identification (ADID) of wetlands is a proactive planning process authorized by Section 404 regulations (40 CFR S230.80) which allows the EPA in cooperation with the COE and the states to collect information on the natural values of wetlands. This information is evaluated by the agencies to determine which wetlands in the ADID study area are of ecologically high value and should be protected from future land use activities. It provides the regulated community with an indication of whether a permit is likely to be approved. When implemented at the local level, ADID results can discourage permit applications to modify high value wetlands, saving time and money.

The ADID process typically involves state and other natural resource agencies in the study of the natural characteristics and functions of specific wetlands. This study may include flood water storage, erosion control, sediment retention, ground water recharge/discharge, water quality enhancement, nutrient retention, food chain support, wildlife and fishery habitats, waterfowl usage, recreational activity, and heritage values. The impact of various land use activities on these wetlands is also evaluated.

The results of ADID studies are published in a Planning Summary Document (PSD) and made available to the public and the regulated community (USEPA, 1991). The PSD contains descriptive information and map data characterizing the wetlands evaluated. Preliminary findings are summarized in the PSD which is circulated for review by federal, state and local agencies and usually is accompanied by a public notice of publication to heighten awareness of the study. Copies of the final PSD are held by all participating agencies and made available to the regulated community and the general public for use when permits are received within the ADID study area.

Between 1989 and 1998, the South Carolina Department of Natural Resources received funding from the EPA, Region 4 (Atlanta, Georgia), to conduct an ADID of Carolina Bay wetlands in the coastal plain of South Carolina. Carolina Bays were selected for advance identification because they are unique wetlands that had been identified in previous studies as containing valuable habitat for significant flora and fauna of the state. This PSD summarizes ADID activities over the past 10 years, including:

- (1) previous studies,
- (2) identification and inventory of candidate bays,
- (3) spatial and tabular database development, and
- (4) image graphics and awareness outreach.

PREVIOUS STUDIES

Carolina Bays are shallow, poorly drained, elliptical (oval), depression features found throughout the Atlantic coastal plain from northeast Florida to southeast New Jersey (Prouty, 1952; Bennett and Nelson, 1991). The Carolina Bay was originally called 'pocosin' which is the Indian word for "swamp on a hill." Bay swamps were so-called due to an abundance of bay trees. Carolina Bays are oriented in a northwest-southeast, shoreline-

perpendicular direction and parallel to one another. They are characterized by nine (9) distinctive features which may be exhibited totally or in part with any given bay. (See Figure 1: "Pee Dee Islands" bays in Marion County.)

- (1) elliptical or oval shape,
- (2) northwest-southeast orientation,
- (3) parallel axes,
- (4) sand rims raised above general level,
- (5) interior surfaces below general level,
- (6) differences between interior and surrounding soils,
- (7) relatively shallow depths,
- (8) flat sandy bottoms beneath interior fill, and
- (9) independence of inflowing or outflowing streams.

Bays share various features with other isolated wetland types, including floristic composition, distribution of vegetation, substrate and origin. In North America, geomorphic features possibly related functionally or formationally to Carolina Bays include upper Midwestern prairie potholes, Alaskan coastal plain clamshell ponds, northern U.S. bog and fen complexes, California vernal pools, and Atlantic coast interdune ponds.

Once an estimated 500,000 bays of all sizes occupied the Atlantic coastal plain, of which 140,000 were moderate to large in size (Prouty, 1952). This estimate (3.5 bays per square mile) may be high due to its basis upon Bladen County, North Carolina, an area of very high Carolina Bay density (Bennett and Nelson, 1991).

Historically, South Carolina is estimated to have more than 4000 Carolina Bays of which 2783 were two acres or larger (Bennett and Nelson, 1991; Schalles, 1989). However, Carolina Bays were probably never as abundant as believed in the past. These estimates are based on surveys of the Savannah River Site in Aiken and Barnwell counties, an area of relatively high bay density (1.5 bays per square mile).

A false sense of abundance and historic disdain for wetlands has likely accounted for lack of concern over abuse and alteration of these systems (Bennett and Nelson, 1991). However, two phenomena of bays have led to renewed interest in their characterization and preservation. First, as isolated wetlands, bays are potential refuges for numerous wetland species within a given geographic area. Often these species may be entirely restricted to local bays. Second, bays historically have received little formal study, resulting in many gaps in knowledge of species distribution. These species include rare plants, amphibians (flatwoods salamander and Carolina gopher frog), reptiles (water snakes, yellow-bellied turtles and alligators), wading birds and mammals (black bear).

In 1983, the Heritage Trust Program (HTP) initiated a survey of Carolina Bays in South Carolina's coastal plain (Bennett and Nelson, 1991). Using both aerial photography and field inspection, the study recorded ecological and geomorphological characteristics

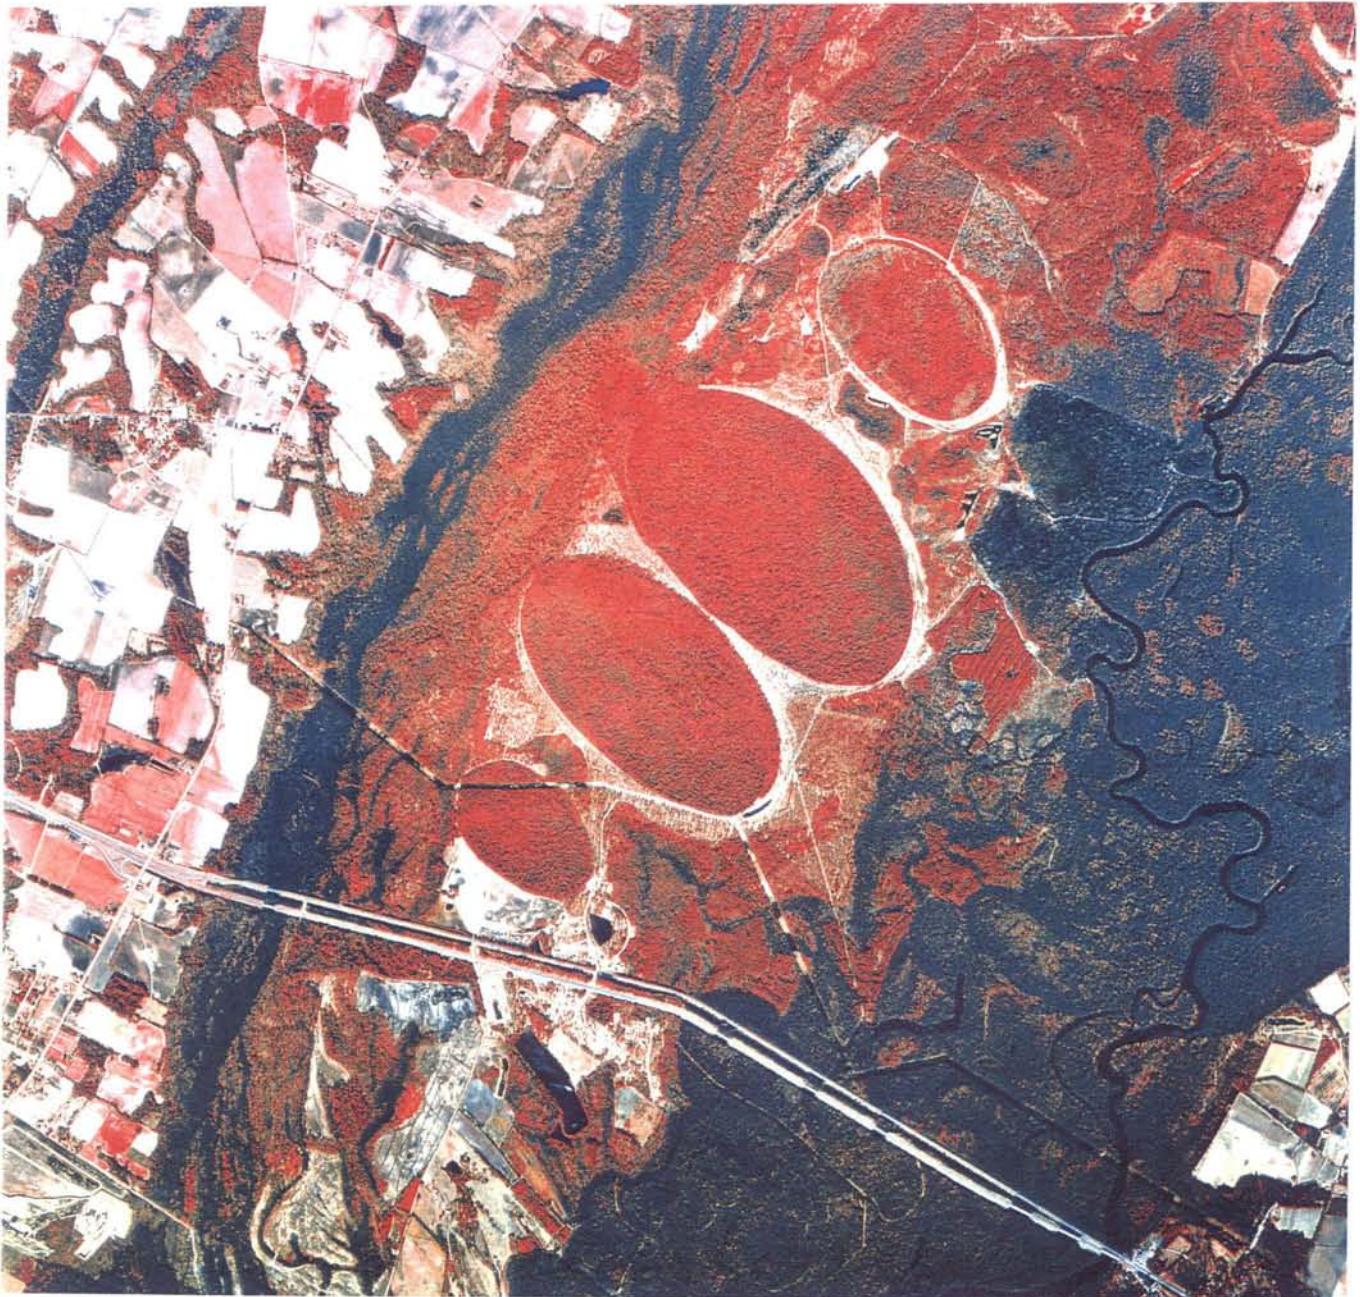

Figure 1: Pee Dee Islands Bay Complex - Marion County, SC

of bays, assessed surrounding land use and disturbance and identified the least altered and most significant bays for inclusion as HTP protection projects.

U.S. Department of Agriculture black and white aerial photography from 1972 to 1983 (mainly 1979-1981) was used to identify 2,651 bays within 29 counties of South Carolina's coastal plain, excluding the Savannah River Site which was inventoried separately under the authority of the U.S. Department of Energy. Bays smaller than two acres were omitted due to confusion with other small, non-elliptical, wet features of the landscape. From the photos, percent of disturbance or alteration, the presence of overlapping bays, sand rim extent and surrounding land use were recorded for each bay. Vegetation type could not be identified from the aerial photographs.

Field survey of the Carolina Bays was conducted from 1983 to 1988. Generally, bays estimated from the aerial photographs as less than 30% disturbed were field inspected for potential protection under the Heritage Trust Program. Of the total 2651 bays, 613 (23%) were identified for ground survey. The degree of disturbance or alteration and other attributes recorded from the aerial photographs were verified during field inspection. Other characteristics that could not be obtained from the photographs including surface water depth, plant species in canopy/shrub/herbaceous layers, and presence of rare plants were recorded. In addition, a general protection priority recommendation was made for each bay visited based on integrity of the bay, the existence of natural communities, the presence of threatened or endangered plant species and the presence of intact sand rims.

During the survey, eleven (11) natural ecosystems were found in South Carolina's bays, adapted from Cowardin *et al.* (1979). Eight are represented in the candidate bay subset and are recorded in the BAYTYPE attribute of Appendix 1.

I - Terrestrial Systems:

xeric sandhill scrub
oak-hickory forest

II - Palustrine Systems:

non-alluvial swamp
pond cypress pond
pond cypress savannah
depression meadow
pocosin
pond pine woodland
bay forest
shrub border

III - Aquatic Systems:

open water lake.

Thirty-six (36) plant species of concern were found during on-site inspection, and were added to the Heritage Trust database. Twenty-three (23) were rare, threatened or endangered plant species include:

Little bur-head (<i>Echinodorus parvulus</i>)	Quill-leaf (<i>Sagittaria isoetiformis</i>),
Spoonflower (<i>Peltandra sagittaefolia</i>)	Sarvis-holly (<i>Ilex amelanchier</i>),
weedy annual mustard (<i>Teesdalia nudicaulis</i>)	Boykin's lobelia (<i>Lobelia boykinii</i>)
Rose coreopsis (<i>Coreopsis rosea</i>)	Savanna butterweed (<i>Helenium pinnatifidum</i>)
Robbin's spike-rush (<i>Eleocharis robbinsii</i>)	Tracy's beak-rush (<i>Rhynchospora tracyi</i>)
perennial sedge (<i>Rhynchospora inundata</i>) (<i>Stillingia aquatica</i>)	Baldwin's nut-rush (<i>Scleria baldwinii</i>) (<i>Hypericum harperi</i>)
Venus' fly-trap (<i>Dionaea muscipula</i>)	Leather-leaf (<i>Cassandra calyculata</i>)
Pond-spice (<i>Litsea aestivalis</i>)	Awn-petaled meadow beauty (<i>Rhexia aristosa</i>)
Creeping seedbox (<i>Ludwigia spathulata</i>)	perennial grass (<i>Anthaenantia rufa</i>)
perennial grass (<i>Amphicarpum muhlenbergianum</i>)	annual grass (<i>Paspalum dissectum</i>)
Canby's dropwort (<i>Oxypolis canbyi</i>)	

The number of bays per county ranged from 3 in Chesterfield County to 410 in Horry County. Bays tend to be larger in the lower coastal plain than in the upper coastal plain, generally decreasing in size inland (Bennett and Nelson, 1991). Mean long axis length by county ranged from 684 feet in Lexington County to 5,094 feet in Georgetown. Twenty-five (25) very large bays, with long axes greater than 10,000 feet, were found in eleven (11) counties. Twenty-two (22) of these bays were located northeast of the Santee River in the northern coastal plain. The largest bay, found in Dillon County, measured 18,748 feet and had been converted to agriculture.

A major conclusion of the study was that there are fewer bays in the state than previously thought and most of them had been significantly altered. From a population of 2651 Carolina Bays, 97% exhibited some type of disturbance, with approximately 81% exhibiting multiple disturbances. Bays in exemplary condition with no disturbance are rare (Bennett and Nelson, 1991). Further, bays tended to be either relatively intact (10% or less disturbed) or almost totally altered (90% or more). Those only with moderate disturbance were less common. Figure 2 contains examples of an intact bay (Woods Bay State Park) and a highly disturbed bay that has been converted to agriculture (Dials Bay) located in close proximity.

Field inspection of the 613 targeted bays showed that 219 bays remained relatively intact (supporting recognizable wetland vegetation and exhibiting little alteration or disturbance). An additional 234 had been functionally altered or disturbed between the date of the aerial photography and the date of the field inspection (average 7 years) and 160 bays had experienced total alteration which was not evident in the aerial photography. These altered bays contained dense canopies of loblolly pine, water oak, sweetgum and other invasive, early succession species and had been drained and probably logged. They are considered "bay regrowth" communities.

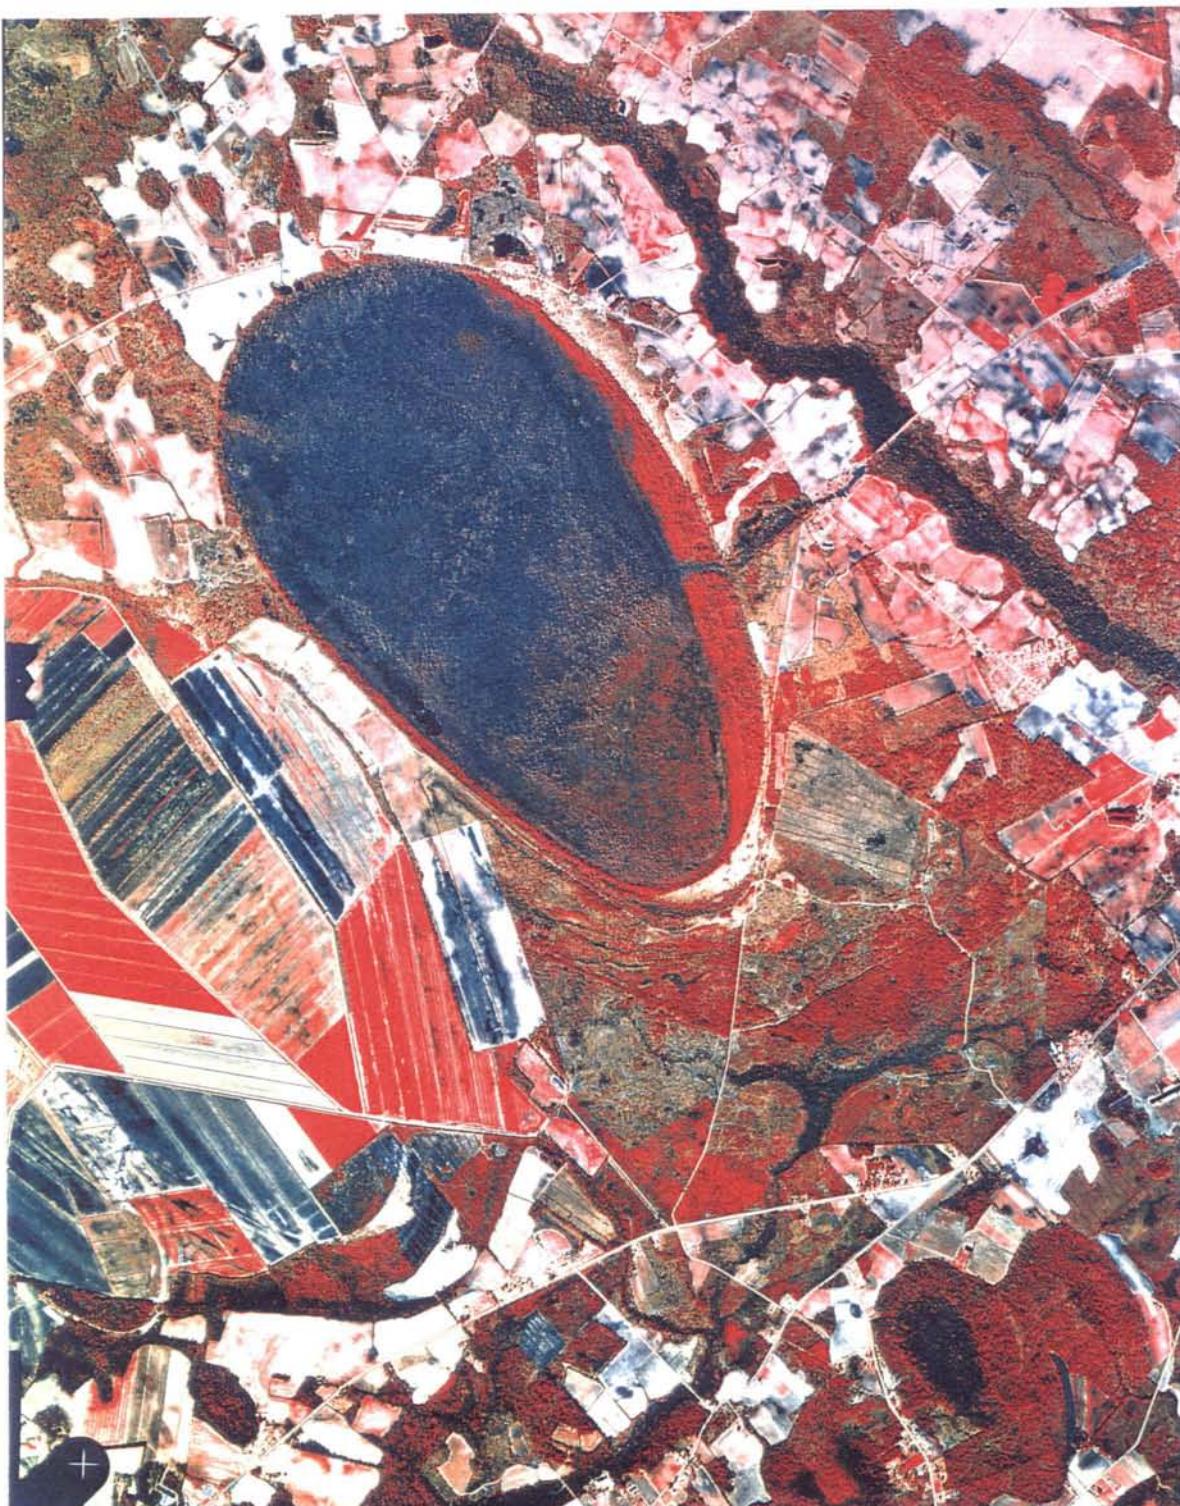

Figure 2: Intact and Disturbed Bays - Woods Bay State Park and Dials Bay

The types of disturbance are numerous and include:

- (1) ditches/channelization,
- (2) row crops/agriculture,
- (3) pine plantations,
- (4) logging,
- (5) roads,
- (6) residential and commercial development,
- (7) transmission rights-of-way, and
- (8) farm ponds.

Upon field visitation, ditches were determined to be more pervasive than observed in air photo interpretation. Ditches or ditch scars were found in virtually every bay visited which were often not apparent on aerial photographs due to canopy closure or ditch age. Some ditches may have functioned to drain uplands into the bay, however, most were designed to drain the bay in order to facilitate agriculture, forestry or other uses of the land. Since no attempts have been made to restore altered bays (at the time of this report), it is unknown whether these systems can be reclaimed (Bennett and Nelson, 1991).

Upper coastal plain bays were generally found to be more highly disturbed than lower coastal plain bays. The northeastern upper coastal plain region of the South Carolina had experienced the highest mean estimated percent disturbance (55%). As indicated by land use mapping and impact assessment studies, this is likely due to draining and clearing for agriculture which historically has been a major impact to native habitats in this area.

Based on this study, specific resource management strategies were developed. First, the 219 relatively intact Carolina Bays were allocated a high priority status for protection since they are unique wetlands and may provide habitat for rare plants and animals. Second, 36 wetlands protection projects were approved for the Heritage Trust Program. At the time of this report, all or portions of seven (7) bays or bay complexes have been acquired or registered by the HTP (Bennett and Nelson, 1991: p. 68).

IDENTIFICATION AND INVENTORY OF CANDIDATE BAYS

The objective of the advance identification (ADID) is to identify and characterize bays of high quality and value as "candidates" for protection. Given the wealth of information generated by the Heritage Trust Program study, discussed in the previous section, no further primary data collection was needed to inventory Carolina Bays in South Carolina. From the original 2,651 documented bays of two acres or larger, 219 bays had been identified that were relatively intact and, therefore, were potential candidate bays. However, additional aerial photography interpretation and field survey were required to verify the status and condition of the bays.

Several criteria were used to evaluate and classify each of the 219 bays as final protection candidates. The criteria included the presence of:

- (1) hydric soils;
- (2) hydrophytic vegetation;
- (3) an intact hydrological regime; and
- (4) a relatively low degree of disturbance within the bay.

Several otherwise non-candidate bays were elevated to candidate status based upon some unique characteristic.

Each of the 219 bays was evaluated by biologists from the Heritage Trust Program and by the state soil scientist to verify their condition. Several methods or combination of methods were employed in the assessment including:

- (1) comparison of survey records to USDA Natural Resources Conservation Service (NRCS) county soil surveys;
- (2) comparison of survey records to vegetation types classified from National Aerial Photography Program (NAPP) 1989 color infrared photography;
- (3) comparison of survey records to U.S. Fish and Wildlife Service (FWS) National Wetlands Inventory (NWI) interpretation of bay hydrology and vegetation;
- (4) estimation of disturbance from aerial photography analysis; and
- (5) field inspection.

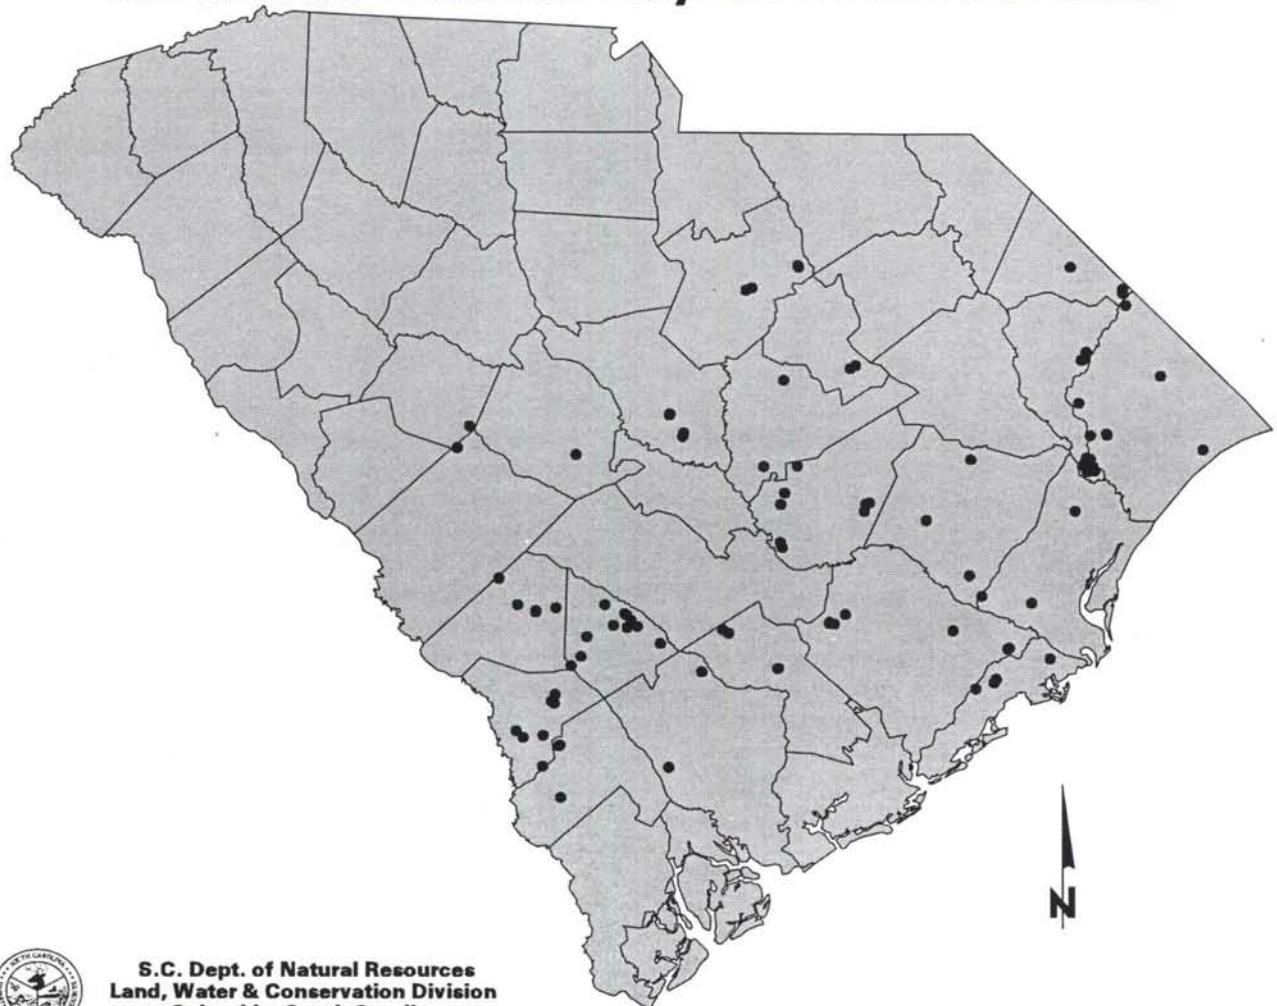

Following this process, the number of viable bay candidates for high-priority protection was reduced from 219 to 165 bays (109 individual bays and two (2) bay complexes containing a total of 56 bays).

SPATIAL AND TABULAR DATABASE DEVELOPMENT

The 165 candidate bays were identified on U.S. Geological Survey 7.5 minute topographic quadrangles during field survey. Fifty-six (56) of the bays were associated with two bay complexes that were plotted as two (2) locations. However, ecological characteristics for all 165 candidate bays were entered into a dBase electronic tabular data base. Center points for the 109 individual bays and two (2) bay complexes were digitized from the topographic maps and stored in an Arc/Info geographic information system (GIS) database (Figure 3). A small subset of the bay characteristics attribute data were converted from dBase to the Info relational data base management system and linked to the spatial center point GIS data base (Table 1).

The entire tabular dBase data file was converted to Wordperfect format which is attached as Appendix 1. This file contains records for each of the 165 candidate bays and includes specific bay characteristics such as bay type, length, surrounding land use,

percent disturbance, vegetative complex and protection project status. A complete listing and definition of the attributes is included at the front of the appendix.

In order to facilitate use of the Carolina Bays data base by local regulatory authorities, the data were converted from Arc/Info coverages to shapefiles. This allows their use with the more common Arcview desktop mapping system that has been employed by local governments throughout the State. The shapefiles contain the center point bay locations and associated tabular data as illustrated in Table 1. The tabular data consists of an internal identification number, a bay identification number, county of occurrence, quadrangle name, and UTM northing and easting coordinates. The bay identification number can be used to manually relate the detailed ecological characterization information in the Appendix 1 to the bay location. At this time, the complete ecological data base has not been imported into a relational data base management system for linkage to the GIS.

Draft NWI maps also were digitized as part of the effort to develop a database supporting candidate bays assessment. These data were used by the Heritage Trust Program biologist and the state soil scientist in their assessment of candidate bays. These data have been replaced with final NWI data updated to 1989 and 1994 photography which are available through the SC DNR GIS Data Clearinghouse.

IMAGE GRAPHICS AND AWARENESS OUTREACH

Once the 165 candidate bays were identified for protection status, an educational effort was initiated to teach the public about the uniqueness and value of Carolina Bays. As part of this outreach program, 10,000 posters were produced resulting in a high-quality graphic product with explanatory text that was distributed to a broad cross-section of the general public. The posters were entitled "Carolina Bays - South Carolina's Mysterious Wetlands" and served as a popular and effective mechanism for transmitting an appreciation and awareness of Carolina Bay wetlands.

A second edition of the poster included a thorough revision of the text and update of basic information. Another 6,300 posters were printed and disseminated through various avenues of distribution. These included the groups listed below:

- (1) SC DNR's Map and Information Center,
- (2) South Carolina Maps and Aerial Photographic Systems (SCMAPS)
educational program jointly administered by the DNR, Clemson University
and S.C. Department of Education which targets middle school students,
- (3) SC DNR educational programs and workshops,
- (4) Coastal Ecosystem Focus Area regional task forces; and
- (5) Soil and Water Conservation Districts (a subdivision of state government at
the county level).

In addition to the poster dissemination, personnel from each of the 27 Conservation Districts where candidate bays exist were trained in bay values and awareness outreach. Educational posters, graphics and other information was provided to the Districts for distribution to farmers, schools and the general public. The primary graphic contained a color infrared aerial photograph and a satellite image of a representative bay from each county simultaneously displayed to illustrate the variation between multiple data sources in depicting bays (Figures 4 and 5). Specific outreach efforts were organized to educate farmers about the existence and value of Carolina Bays because of the historic role of agriculture in their alteration and destruction.

District offices located in the counties listed below were the primary focus of these educational efforts.

SUMMARY

Historically, the South Carolina coastal plain contained numerous unique Carolina Bay wetlands. Over the past three centuries, what was estimated to have been more than 4000 bays, has been reduced to 165 that are relatively intact and warranted for protection. Agriculture, forestry, and various other land use practices have destroyed or altered most of the original bay systems.

This advance identification (ADID) process established procedures and criteria to identify, characterize, and prioritize the best of the remaining bays as candidates for protection. Using the inventory data from previous studies, assessment characteristics were defined which included hydric soils, hydrophytic vegetation, hydrologic regime, and level of disturbance. The assessment evaluated the combination of characteristics for each bay that least detracted from its natural pristine condition. One hundred and nine (109) individual bays and two bay complexes (composed of 56 individual bays) have been recommended by this process for protection.

The location of the 109 candidate bays and 2 bay complexes were digitized into a geographic information system (GIS) and can be used with other data at the local level as part of their resource planning and management strategies. In addition, electronic files containing the ecological characteristics for each candidate bay were created that provide information on their vegetative composition, physical dimension, location and condition.

Through training sessions and public awareness opportunities, numerous civic organizations, government agencies, and private citizens were educated on the presence and importance of Carolina Bay wetlands protection to South Carolina. Various posters and aerial photographs were used to convey the complexity of Carolina Bay systems and their unique role in maintaining the state's biodiversity.

APPENDIX 1:

**ECOLOGICAL CHARACTERIZATION ATTRIBUTES FOR
CANDIDATE CAROLINA BAYS IN SOUTH CAROLINA**

ECOLOGICAL CHARACTERIZATION ATTRIBUTES FOR CANDIDATE CAROLINA BAYS

<u>Attribute</u>	<u>Definition</u>	<u>Value format</u>
COUNTY	County where bay is located	Character
BAYID	Identification number	Integer value
COMPLEX	Presence of bay within a complex	Yes/No
LALENGTH	Long axis length of bay	Integer (feet)
PCNTDIST	Percent bay disturbance	Integer (%)
DISTTYPE	Disturbance type	CO = Commercial development DI = Ditch FP = Farm Ponds LO = Logging PP = Pine plantation RC = Row crop RD = Road RE = Residential development RM = Road in Margin ROW = Right of way RTB = Road through bay
SANDRIM	Sand rim location	Compass direction or absent
SURRLAND	Type of surrounding land use	CO = Commercial development LO = Logging PP = Pine plantation RC = Row crop RD = Road RE = Residential development
BAYTYPE	Type of bay natural community	Character
DISTCOMM	Disturbance comments/notes	Character
CANOPY	Over-story vegetation type(s)	Species scientific name(s)
SHRUB	Mid-story vegetation type(s)	Species scientific name(s)
GRNDCOV	Under-story vegetation type(s)	Species scientific name(s)
SIGNATEL	Significant natural elements (Represents rare, threatened or endangered species or communities/species of special concern)	Species scientific name(s) or community name
OWNER	Property owner (if available)	Character
PROTPROJ	Heritage Trust Program protection project	Yes/No
FLDSURDAT	Field survey date	Date (Year 2000 compliant)
UTMCOOR	Universal Transverse Mercator coordinates	Northing & Easting (in meters)
TOPOQUAD	US Geological Survey (USGS) 7.5 minute topographic quadrangle map name	Character
